Monetary and Exchange Rate Policies in a Global Economy

Naoki Yago

The University of Cambridge

February 10, 2025

Introduction

- Foreign exchange intervention (FXI)
 - Central banks buy/sell foreign currency reserves
 - ex. China buys yuan, sells dollar reserves ⇒ yuan expensive
- Classical theory: inflation stabilization (Mundell-Fleming)
- In practice: exchange rate stabilization (Rey'15)
- I construct a theory with both monetary policy and FXI.
 - Which policy should central banks use?

Two Tensions between Theory & Practice

Tension 1:

- Literature: small open economies
- Reality: large open economies use FXI actively

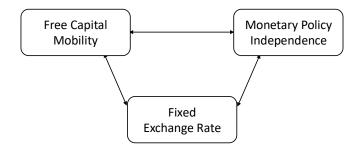

Tension 2:

- <u>Literature</u>: separate objectives
 - Monetary policy \Rightarrow inflation, FXI \Rightarrow exchange rate
- Reality: related objectives
 - ex. Pandemic & war, high inflation
 - Low interest rates and intervention by selling the dollar

What I do

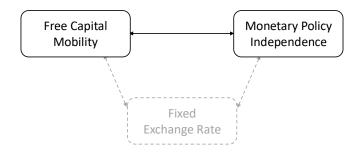

- A large two-country theory with monetary policy and FXI based on:
 - Monetary policy in large open economies (Corsetti/Dedola/Leduc'23)
 - FXI in small open economies (Basu/etal'20, Itskhoki/Mukhin'23)
- **Result:** the two policies are interdependent for large countries.
 - FXI affects inflation by dampening/stimulating foreign demand

International Macro in the Past Decades

Classical Theory (Mundell-Fleming)

International Macro in the Past Decades

- Recently: financial globalization & international shock transmission
- CB cannot keep monetary independence under free capital mobility even with a flexible exchange rate (Rey'15)

International Macro in the Past Decades

Model Takeaway:

- Without FXI, external shocks weaken the MP independence
 - MP cannot stabilize domestic inflation/output
- FXI improves the MP independence
 - Stabilize inflation/output with small interest rate changes
 - FXI complements the MP

Literature

00000

- Theory on foreign exchange intervention
 - Gabaix/Maggiori'15, Fanelli/Straub'21: FXI independently of MP
 - Cavallino'19, Amador/etal'20, Basu/etal'21, Itskhoki/Mukhin'23:
 MP and FXI in a small open economy
 - ⇒ Two-country theory with both monetary policy and FXI
- Empirical evidence on the effectiveness of FXI
 - Fatum/Hutchison'10, Kuesteiner/Phillips/Villamizar-Villegas'18, Fratzscher/etal'19, Adler/Mano'21, Rodnyansky/Timmer/Yago'24, Dao/Gourinchas/Mano/Yago'24
 - ⇒ Normative implication of FXI
- Non-fundamental volatility of exchange rates
 - Itskhoki/Mukhin'21, Jiang/Krishnamurthy/Lustig'21,23, Devereux/Engel/Wu'23, Engel/Wu'22, Kekre/Lenel'23, Fukui/Nakamura/Steinsson'23
 - ⇒ Role of FXI in stabilizing exchange rates

Roadmap

Step-by-step construction of a large two-country model

- (Corsetti/Dedola/Leduc'23) (Known) starting point: monetary policy
- Model setup: monetary policy & FXI
- Optimal policy under cooperation
- Extension: Dollar pricing
- Sobustness: Optimal policy under non-cooperation

Roadmap

Step-by-step construction of a large two-country model

- (Corsetti/Dedola/Leduc'23) (Known) starting point: monetary policy
 - Define international risk-sharing
 - Inflation-output trade-off due to the lack of risk-sharing
- Model setup: monetary policy & FXI
- Optimal policy under cooperation
- Extension: Dollar pricing
- Sobustness: Optimal policy under non-cooperation

Monetary Policy under Cooperation (Corsetti/Dedola/Leduc'23)

- Two symmetric large open economies: local & US
- Households consume local & US goods, supply labor Details

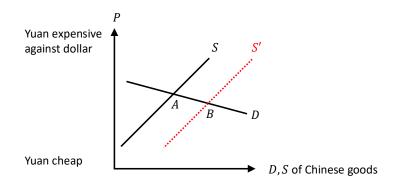

$$U(C_t) = \log(C_t), \qquad C_t = \left[a^{rac{1}{\phi}}C_{Lt}^{rac{\phi-1}{\phi}} + (1-a)^{rac{1}{\phi}}C_{Ut}^{rac{\phi-1}{\phi}}
ight]^{rac{\phi}{1-\phi}}$$

- Cannot trade state-contingent asset internationally
- Firms produce goods, price rigidity (Calvo'83)
 - Shocks: productivity and markup (cost-push)
 - Export in own currency
- Global planner sets local and US monetary policy rates

International Risk Sharing (Concept)

- Cooperation: planner targets <u>risk-sharing</u> (consumption smoothing)
 - China supply $\uparrow \rightarrow$ China consumption $\uparrow \uparrow$
 - Cheap yuan → US import price ↓, US consumption ↑

International Risk Sharing (Definition)

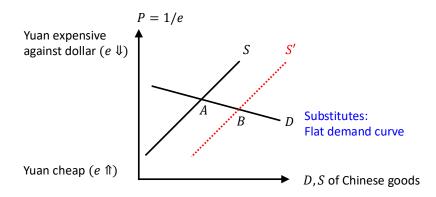

Risk-sharing wedge = Difference in marginal utilities

$$\begin{split} \tilde{\mathcal{W}}_t &\equiv \widetilde{U'(C_t^*)} - \widetilde{U'(C_t)} - \tilde{e}_t \\ &= \tilde{C}_t - \tilde{C}_t^* - \tilde{e}_t \quad \text{(with log utility)} \end{split}$$

- $\tilde{\mathcal{W}}_t > 0$ (China excess demand) when:
 - $\tilde{C}_t > \tilde{C}_t^*$ (China > US consumption)
 - $\tilde{e}_t \downarrow$ (Yuan is expensive against the dollar)

Lack of Risk Sharing when Goods are Substitutes

- China productivity ↑
 - \rightarrow China consumption $C \uparrow but small yuan depreciation <math>e \uparrow but small yuan depreciation <math>e \uparrow but small yuan depreciation e \uparrow but small yuan depreciation <math>e \uparrow but small yuan depreciation e \uparrow but small yuan depreciation <math>e \uparrow but small yuan depreciation e \uparrow but small yuan depreciation e \uparrow but small yuan depreciation e <math>but small yuan depreciation e \uparrow but small yuan depreciation e <math>but small yuan depreciation e \uparrow but small yuan depreciation e <math>but small yuan depreciation e for a but small yuan depreciation e <math>but small yuan depreciation e for a but small yuan depreciation e <math>but small yuan depreciation e for a but small yuan depreciation e for a but small yuan depreciation e <math>but small yuan depreciation e for a but small yuan depreciation e fo$
 - ightarrow China excess demand ($ilde{W} = ilde{C} ilde{C}^* ilde{e} > 0)$

Price Setting

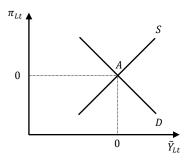

Monetary Policy

$$\pi_{Lt} = \beta E_t \pi_{Lt+1} + \kappa \left[\tilde{Y}_{Lt} - \underbrace{2 a (1-a) (\phi-1) \tilde{\mathcal{T}}_t}_{\text{Terms-of-trade gap}} \right. \\ \left. + \underbrace{(1-a) \tilde{\mathcal{W}}_t}_{\text{Risk-sharing wedge}} \right. \\ \left. + \underbrace{\mu_t}_{\text{Markup shock}} \right]$$

- π_{Lt} : inflation (local goods consumed by local households)
- \tilde{Y}_{Lt} : output gap
- $\tilde{\mathcal{T}}_t$: terms-of-trade gap (import export price)
 - Import price $ilde{\mathcal{T}}_t \Downarrow \to \mathsf{consumption} \uparrow$, inflation \uparrow
- $\tilde{\mathcal{W}}_t$: Local excess demand \rightarrow inflation \uparrow
 - (ϕ : substitution of local/US goods, 1 a: trade openness)

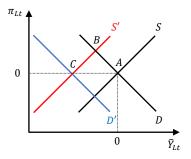

Monetary Policy Trade-off: (1) Inflation Targeting

- ullet Local productivity $A_t \Uparrow o ext{inflation} \Downarrow$
 - \rightarrow Interest rate \Downarrow so that inflation = output gap = 0 (Similar to the closed economy)

Monetary Policy Trade-off: (2) Risk-Sharing Channel

- Assume inflation targeting $(\pi_{Lt} = 0)$ & goods are substitutes
- Local productivity $A_t \Uparrow \to \operatorname{demand} \tilde{\mathcal{W}}_t \Uparrow \to \operatorname{inflation} \pi_{Lt} \Uparrow$
 - ightarrow Interest rate \Uparrow to target inflation ightarrow output gap $ilde{Y}_{Lt} \Downarrow$

Roadmap

Step-by-step construction of a large two-country model

- (Known) starting point: monetary policy
- Model setup: monetary policy & FXI
 - FXI is effective under frictions in international asset trade (Gabaix/Maggiori'15, Itskhoki/Mukhin'23)
 - FXI affects the inflation-output trade-off of monetary policy
- Optimal policy under cooperation
- Extension: Dollar pricing
- 5 Robustness: Optimal policy under non-cooperation

FXI: Basic Idea

- Central banks use both MP and FXI
- <u>Data:</u> unhedged returns on savings are different across currencies
 - Uncovered Interest Parity (UIP) deviation (Fama'94)
- Assume households can only borrow/lend in their own currency.
 - ⇒ FXI affects the exchange rate (Gabaix/Maggiori'15, Itskhoki/Mukhin'21)
- **Example:** China buys the yuan \rightarrow return on yuan < \$
 - Households cannot borrow in yuan to invest in \$
 - (More formally) limits to financial intermediation

No FXI and UIP shocks (known in Corsetti/Dedola/Leduc'23)

$$\underbrace{\underbrace{E_t \tilde{\mathcal{W}}_{t+1} - \tilde{\mathcal{W}}_t}_{\tilde{\mathcal{W}}_t > 0: \text{ local demand}}}_{\tilde{\mathcal{W}}_t = \underbrace{\tilde{r}_t - \tilde{r}_t^*}_{\text{Incertex rate}} - \underbrace{\underbrace{(E_t \tilde{e}_{t+1} - \tilde{e}_t)}_{\text{Local expected depreciation}}}_{\text{depreciation}} = 0$$

(ẽ ↑: local cheap)

- Same return \rightarrow consumption smoothing on average
- When goods are substitutes, $\tilde{\mathcal{W}}_t \neq 0$
 - → MP trades off inflation-output

Formalization of Gabaix/Maggiori'15 gives:

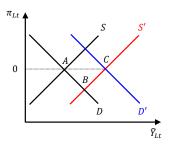

$$\underbrace{E_t \tilde{\mathcal{W}}_{t+1} - \tilde{\mathcal{W}}_t}_{\tilde{\mathcal{W}}_t > 0: \text{ local demand}} = \underbrace{\tilde{r}_t - \tilde{r}_t^*}_{\text{Local}} - \underbrace{\left(E_t \tilde{e}_{t+1} - \tilde{e}_t\right)}_{\text{Local expected depreciation}} = \underbrace{\omega f_t^*}_{\text{FXI}}$$

(
$$\omega$$
: intermediation friction, $f_t^* > 0$: buy \$ / sell local)

- Buy \$: \rightarrow \$ expensive $(\tilde{e}_t \uparrow)$, return on local > \$
 - Local demand $\tilde{\mathcal{W}}_t \Downarrow$
 - FXI affects the MP trade-off (My paper's focus)

FXI Affects the Inflation/Output Trade-off

- Buy $\$ \rightarrow \$$ expensive
- Income effect:
 - Local demand $\tilde{\mathcal{W}}_t \downarrow \!\!\!\downarrow$, $\pi_{Lt} \downarrow \!\!\!\!\downarrow \rightarrow$ interest rate $\downarrow \!\!\!\downarrow$, $\tilde{Y}_{Lt} \uparrow \!\!\!\!\uparrow$
- Substitution effect:
 - Demand shifts from US to local goods, $\tilde{Y}_{Lt} \uparrow \uparrow$

FXI Affects the Inflation/Output Trade-off

- Buy $\$ \rightarrow \$$ expensive
- Income effect:
 - Local demand $\tilde{\mathcal{W}}_t \Downarrow$, $\pi_{Lt} \Downarrow \rightarrow$ interest rate \Downarrow , $\tilde{Y}_{Lt} \uparrow$
- Substitution effect:
 - Demand shifts from US to local goods, $\tilde{Y}_{lt} \uparrow$
- Implications:
 - The planner cares about both domestic and global distortions
 - FXI affects the inflation-output trade-off of monetary policy via changes in the exchange rate and global demand

Roadmap

Step-by-step construction of a large two-country model

- (Known) starting point: monetary policy
- Model setup: monetary policy & FXI
- Optimal policy under cooperation
 - Analytical characterization of optimal MP and FXI rules
 - Calibrate the model and quantify the effect of FXI
 - Show that FXI mitigates the MP trade-off
- Extension: Dollar pricing
- Sobustness: Optimal policy under non-cooperation

- Planner maximizes the sum of welfare in the two countries.
- Minimize the weighted sum of:
 - Inflation rate for goods produced in each country (producer-price)
 - Output gap in each country
 - Risk-sharing wedge across countries (Corsetti/Dedola/Leduc'23)
- Analytical FXI rule + quantification
- Calibration: FXI & UIP data for 11 major currencies

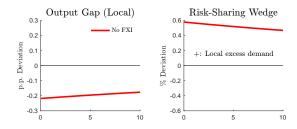

Optimal Policy: Cooperation & Commitment

- Planner maximizes the sum of welfare in the two countries
- Minimize the weighted sum of: Objective function
 - Inflation rate for goods produced in each country (producer-price)
 - Output gap in each country
 - Risk-sharing wedge across countries
- Case 1: No FXI, inflation-targeting MP (Recap of Corsetti/etal'23)
- Case 2: Optimal FXI, inflation-targeting MP
- Case 3: Optimal MP & FXI

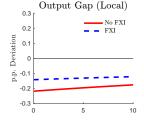

Case 1: Inflation-Targeting MP, No FXI (Recap)

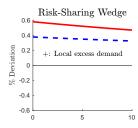

- Assume inflation targeting $(\pi_{Lt} = 0)$ & goods are substitutes
- ullet Local productivity $A_t \Uparrow o \operatorname{\mathsf{demand}} ilde{\mathcal{W}}_t \Uparrow$
 - ightarrow Inflation $\pi_{Lt} \uparrow \uparrow \rightarrow$ interest rate $\uparrow \uparrow$, output gap $ilde{Y}_{Lt} \downarrow \downarrow$

Case 2: Optimal FXI, Inflation-Targeting MP (Concept)

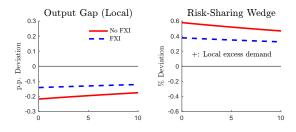

- ullet Buy \$ o \$ expensive
- Income effect:
 - Local demand $\tilde{\mathcal{W}}_t \downarrow \!\!\!\downarrow$, $\pi_{Lt} \downarrow \!\!\!\downarrow \rightarrow$ interest rate $\downarrow \!\!\!\downarrow$, $\tilde{Y}_{Lt} \uparrow \!\!\!\uparrow$
- Substitution effect:
 - Demand shifts from US to local goods, \tilde{Y}_{Lt} \uparrow

Case 2: Optimal FXI, Inflation-Targeting MP (Concept)

- Without FXI, monetary policy trades off inflation and output due to the lack of risk-sharing.
- FXI mitigates this monetary policy trade-off.

Case 2: Optimal FXI, Inflation-Targeting MP (Formal)

Optimal FXI rule:

$$f_{t}^{*} = -\xi_{Y}\{(\tilde{Y}_{Lt} - E_{t}\tilde{Y}_{Lt+1}) - (\tilde{Y}_{Ut} - E_{t}\tilde{Y}_{Ut+1})\}$$

Transmission:

$$\left(\frac{\partial \tilde{Y}_{Lt}}{\partial A_t}\right)^{\text{No FXI}} < \left(\frac{\partial \tilde{Y}_{Lt}}{\partial A_t}\right)^{\text{FXI}} < 0$$

$$\left(\frac{\partial \tilde{\mathcal{W}}_t}{\partial A_t}\right)^{\mathsf{No}\;\mathsf{FXI}} > \left(\frac{\partial \tilde{\mathcal{W}}_t}{\partial A_t}\right)^{\mathsf{FXI}} > 0$$

Local output $\tilde{Y}_{Lt} \Downarrow$ $\rightarrow \text{Buy } \{ (f_t^* > 0) \}$

Output gap \tilde{Y}_{Lt}

 \rightarrow less negative

Risk-sharing gap $ilde{\mathcal{W}}_t$

 \rightarrow less positive

Case 3: Optimal MP and FXI (Concept)

- No FXI: Local productivity $A_t \uparrow \uparrow \rightarrow \text{demand } \tilde{\mathcal{W}}_t \uparrow \uparrow$, inflation $\pi_{Lt} \uparrow \uparrow$
- **FXI:** Buy \$ o \$ expensive o demand $\tilde{\mathcal{W}}_t \Downarrow$, inflation $\pi_{Lt} \Downarrow$
- FXI mitigates the inflation-output trade-off of monetary policy.

Case 3: Optimal MP and FXI (Formal)

Optimal MP rule:

$$\begin{aligned} 0 &= \theta \pi_{Lt} + (\tilde{Y}_{Lt} - \tilde{Y}_{Lt-1}) \\ &- \xi_{\mathcal{T}} (\tilde{\mathcal{T}}_t - \tilde{\mathcal{T}}_{t-1}) + \xi_{\mathcal{W}} (\tilde{\mathcal{W}}_t - \tilde{\mathcal{W}}_{t-1}) \end{aligned}$$

Optimal FXI rule:

$$\mathbf{f}_{t}^{*} = -\xi_{Y}\{(\tilde{Y}_{Lt} - E_{t}\tilde{Y}_{Lt+1}) - (\tilde{Y}_{Ut} - E_{t}\tilde{Y}_{Ut+1})\}$$

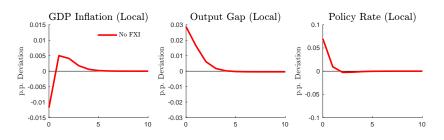

Interest rate \uparrow (inflation $\pi_{Lt} \downarrow$) when:

- Local output \tilde{Y}_{Lt} \uparrow
- Import price $\tilde{\mathcal{T}}_t \Downarrow$ (\rightarrow demand \Uparrow)
- Local demand $\tilde{\mathcal{W}}_t \uparrow$

Local output
$$\tilde{Y}_{Lt} \Downarrow$$
 $\rightarrow \text{Buy } \{ (f_t^* > 0) \}$

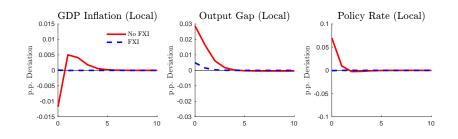

Cost-Push Shock (Case 1: No FXI, Optimal MP)

- US cost-push inflation \rightarrow \$ expensive
 - Local demand $\tilde{\mathcal{W}}_t \downarrow$, inflation $\pi_{Lt} \downarrow$
 - ullet US demand for local goods \uparrow , output gap $ilde{Y}_{Lt} \uparrow \uparrow \to {\sf interest\ rate\ } \uparrow$
- External shocks weaken monetary policy independence

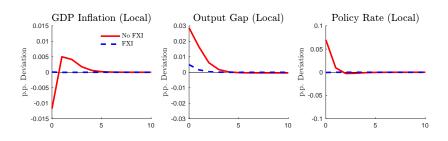

Cost-Push Shock (Case 2: Optimal MP & FXI)

- Buy local → local expensive
 - Local demand $\tilde{\mathcal{W}}_t \uparrow$, inflation \uparrow
 - US demand for local goods ↓, output gap ↓ → interest rate ↓

Cost-Push Shock (Case 2: Optimal MP & FXI)

- FXI improves monetary policy independence
 - Stabilizes inflation-output with small interest rate changes
 - Insurance against external shocks
- FXI trades off inflation-output and risk-sharing

Model Takeaway

- Without FXI, external shocks weaken the MP independence
- FXI improves the MP independence and complements the MP
- <u>Literature:</u> separate objectives
 - MP \Rightarrow inflation/output, FXI \Rightarrow capital flow (UIP) shocks
- My paper: related objectives

Roadmap

Step-by-step construction of a large two-country model

- (Known) starting point: monetary policy
- Model setup: monetary policy & FXI
- Optimal policy under cooperation
- Extension: Dollar pricing
 - Optimal FXI targets inefficient price dispersion across countries
 - Optimal FXI volume is large and transmission is asymmetric
 - Popularity of FXI in a dollarized world
- Sobustness: Optimal policy under non-cooperation

Producer Currency Pricing (Recap)

- Previous section:
 - Exports are invoiced in the exporters' (producers') currency
 - The law of one price holds

- ullet P_{Lt} , P_{Lt}^* : The price of local goods faced by the local/US households
- $m{\circ}$ \mathcal{E}_t : nominal exchange rate, $\mathcal{E}_t \Uparrow = \mathsf{dollars}$ expensive

Dollar Pricing

- Bridge the gap between:
 - Dollar dominance in international trade (Gopinath/etal'20)
 - Capital flow management in international finance (Itskhoki/Mukhin'23)
- Assume both exports and imports are invoiced in dollars
- The law of one price does not hold

$$P_{Lt}$$
 \neq $\mathcal{E}_t P_{Lt}^*$

Dollar Pricing

• \$ expensive $\mathcal{E}_t \Uparrow \to \mathsf{local} < \mathsf{US}$ price of local goods compared in the local currency (despite the same marginal cost)

$$\underbrace{\mathcal{E}_{t} \uparrow}_{\text{Sticky in the}} \times \underbrace{\mathcal{E}_{t}^{*}}_{\text{expensive}} \times \underbrace{\mathcal{P}_{Lt}^{*}}_{\text{dollars}}$$

Dollar Pricing

- $\Delta_{Lt} \equiv \mathcal{E}_t P_{Lt}^* / P_{Lt} \neq 1$: price of local goods sold in US / local
- ullet Central banks target Δ_{Lt} under cooperation ullet NKPC and loss function

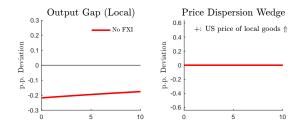

(Engel'11, Corsetti/Dedola/Leduc'20,23)

$$\underbrace{P_{Lt}}_{\text{Sticky in the}} < \underbrace{\mathcal{E}_t \uparrow}_{\text{expensive}} \times \underbrace{P_{Lt}^*}_{\text{Sticky in}}, \qquad \underbrace{\Delta_{Lt}}_{\text{Price dispersion wedge}} > 1$$

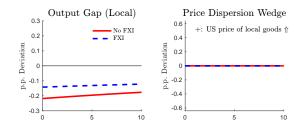

Case 1: Producer Currency Pricing (Recap)

- Assume MP targets inflation (producer price)
- No FXI: Local productivity $A_t \uparrow \uparrow \rightarrow \operatorname{demand} \tilde{\mathcal{W}}_t \uparrow \uparrow$
 - \rightarrow Inflation $\pi_{Lt} \uparrow \uparrow \rightarrow$ interest rate $\uparrow \uparrow$, output gap $Y_{Lt} \downarrow \uparrow$

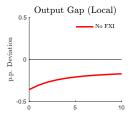

Case 1: Producer Currency Pricing (Recap)

ullet Buy $\ \to \ \$ expensive $\ o \ \$ demand local goods, $\ ilde Y_{Lt} \ \! \uparrow$

Case 2: Dollar Pricing (Concept)

- **No FXI:** Local productivity $A_t \uparrow \rightarrow \$$ expensive
 - \rightarrow US price of local goods $\Delta_{Lt} \uparrow$

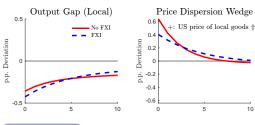

N Full IDFs (sound) sets the

Full IRFs (cost-push

Case 2: Dollar Pricing (Concept)

- **FXI**: Sell $\$ \rightarrow \$$ cheap
 - US price of local goods $\Delta_{Lt} \Downarrow \rightarrow \underline{\text{stabilize}}$ price dispersion
 - ullet Demand for local goods $ilde{Y}_{Lt} \downarrow \to \underline{\text{destabilize}}$ the output gap
- FXI trades off internal and external objectives

Case 2: Dollar Pricing (Formal)

Optimal FXI rule:

$$\begin{split} \mathbf{f}_{t}^{*} &= -\xi_{Y}^{DCP} \{ (\tilde{\mathbf{Y}}_{Lt} - E_{t} \tilde{\mathbf{Y}}_{Lt+1}) - (\tilde{\mathbf{Y}}_{Ut} - E_{t} \tilde{\mathbf{Y}}_{Ut+1}) \} \\ &+ \xi_{\Delta}^{DCP} (\tilde{\underline{\Delta}}_{Lt} - E_{t} \tilde{\underline{\Delta}}_{Lt+1}) \end{split}$$

Local output $\tilde{Y}_{Lt} \uparrow$,

US price of local goods $\tilde{\Delta}_{I,t} \uparrow \uparrow$

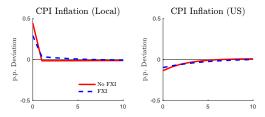

$$\rightarrow$$
 Sell \$ $(f_t^* < 0)$

Dollar Pricing: Quantitative Implications

Optimal FXI volume is large and direction can change

| FXI / GDP (%) | Producer Pricing | Dollar Pricing |
|------------------------|------------------|-----------------|
| Local Productivity ↑ | Buy \$ (0.013%) | Sell \$ (0.22%) |
| US Cost-Push Inflation | Sell \$ (0.25%) | Sell \$ (0.29%) |

- Transmission is asymmetric: FXI stabilizes local consumer inflation
 - Dollar exchange rate affects local import prices in dollars

Roadmap

Step-by-step construction of a large two-country model

- (Known) starting point: monetary policy
- Model setup: monetary policy & FXI
- Optimal policy under cooperation
- Extension: Dollar pricing
- Sobustness: Optimal policy under non-cooperation
 - FXI stabilizes domestic inflation/output but destabilizes foreign inflation/output and international risk-sharing
 - Abstract from full strategic interaction in repeated games

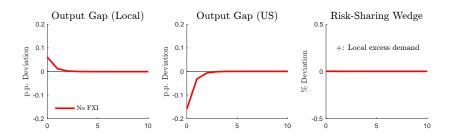

Robustness: Non-Cooperative Equilibrium

- CB in each country maximizes domestic objective
 - Abstract from full strategic interaction in repeated games
- Assumptions:
 - CBs target domestic inflation/output gap (Bodenstein/etal'23)
 - Case 1: Local CB uses both MP & FXI, US CB uses only MP
 - Case 2: Local CB uses only MP, US CB uses both MP & FXI

Maximization & ontimal rules

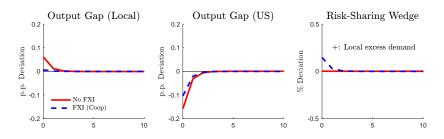

No FXI, Inflation-Targeting MP (Recap)

- Assume MP targets zero inflation in each country
- US cost-push inflation
 - **Direct:** US interest rate \uparrow , $\tilde{Y}_{Ut} \downarrow$
 - Indirect: \$ expensive $\rightarrow \tilde{Y}_{Lt} \uparrow \uparrow, \tilde{Y}_{Ut} \downarrow$

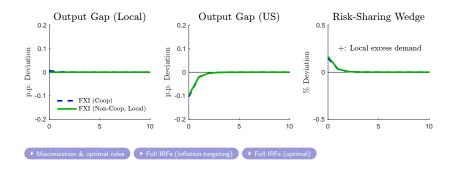

Cooperative FXI (Recap)

- Buy local → local expensive
 - Demand for local goods \Downarrow , $\rightarrow \tilde{Y}_{Lt} \Downarrow$, $\tilde{Y}_{Ut} \uparrow \uparrow$
 - FXI stabilizes the output gaps but destabilizes the risk-sharing

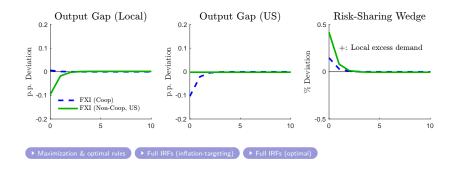

Case 1: Non-Cooperative FXI by the Local Central Bank

- Local CB uses FXI non-cooperatively
 - ullet FXI stabilizes the local output gap over time: $E_t ilde{Y}_{Lt+1} = ilde{Y}_{Lt}$
 - Small difference between cooperation and non-cooperation

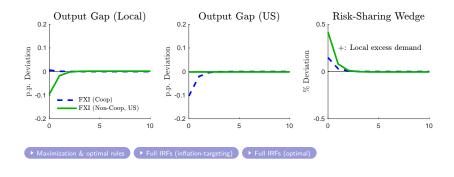

Case 2: Non-Cooperative FXI by the US Central Bank

- ullet US CB (Fed) stabilizes the US output gap over time: $E_t ilde{Y}_{Ut+1} = ilde{Y}_{Ut}$
 - ullet US sells \$ o \$ cheap o $ilde{Y}_{Lt} \Downarrow, ilde{Y}_{Ut} \Uparrow$
 - However, FXI destabilizes the local output gap and risk-sharing

Case 2: Non-Cooperative FXI by the US Central Bank

- Non-cooperative FXI <u>stabilizes</u> domestic inflation-output but <u>destabilizes</u> foreign output and risk-sharing
- Exchange rate should be set cooperatively

Conclusion

- A two-country framework with monetary policy and FXI
 - Characterize optimal MP and FXI rules
- Without FXI, MP faces an inflation-output trade-off
- FXI mitigates this trade-off & improves MP independence
 - FXI insulates countries from global business cycles
- Challenges:
 - Identification of FXI, empirical analysis (Rodnyansky/Timmer/Yago'24)
 - How to combine FXI with capital control and macroprudential policy (Basu/etal'20)

Appendix

Monetary Policy and FXI: Recent Examples

- Low interest rate policy during the pandemic and war:
 - China and India set a record low of 4% interest rate.
 - Brazil lowered the rate to 2%.
 - Japan set a negative interest rate.
- FXI by large open economies:
 - China and Japan have 3.5 trillion and 1.4 trillion dollars of foreign exchange reserves
 - 40% of the world's reserves, 20-30% of Chinese/Japanese GDP
 - US monitoring list for gaining unfair competitive advantage in trade
 - World foreign exchange reserves fell by 1 trillion dollars in 2021-22.
 - China and Brazil sold 38 billion and 25 billion dollars in 2020.
 - India and Japan sold 32 billion and 63 billion dollars in 2022.

Literature on MP and FXI in Open Economy

Literature on MP & FXI in a Small Open Economy

- Cavallino (2019)
 - Cost for central banks: FX purchase lowers the FX return
 - Profit for intermediaries: opposite carry trade position against central banks
 - Domestic intermediaries share $\beta=1$: loss = profit, $\beta<1$: loss > profit
- Basu et al. (2020) (IMF Integrated Policy Framework)
 - Sudden stop ⇒ a monetary easing relaxes banks' domestic borrowing constraint but depreciation tightens their external borrowing constraint
 - FX sales limit the depreciation and improves the trade-off
- Itskhoki and Mukhin (2023)
 - MP and FXI eliminate nominal and financial frictions separately
 - Without FXI, MP trades off inflation and exchange rate stabilization
- My paper:
 - FXI trades off the internal (inflation) & external objectives (exchange rate, purchasing power)
 - Cooperative MP & FXI in two large countries

Households (Details)

CRRA, CES bundle of local and US goods

$$\begin{split} U(C_t, L_t) &= \frac{C_t^{1-\sigma}}{1-\sigma} - \zeta_l \frac{L_t^{1+\eta}}{1+\eta}, \quad C_t = \left[a^{\frac{1}{\phi}} C_{Lt}^{\frac{\phi-1}{\phi}} + (1-a)^{\frac{1}{\phi}} C_{Ut}^{\frac{\phi-1}{\phi}} \right]^{\frac{\phi}{1-\phi}} \\ C_{Lt} &= \left[\int_0^1 C_t(l)^{\frac{\theta-1}{\theta}} dj \right]^{\frac{\theta}{1-\theta}}, \quad C_{Ut} = \left[\int_0^1 C_t(u)^{\frac{\theta-1}{\theta}} du \right]^{\frac{\theta}{1-\theta}} \end{split}$$

- $\sigma = \phi = 1$: log and Cobb-Douglas utility (Cole/Obstfeld '91)
- Budget constraint:

$$P_{Lt}C_{Lt} + P_{Ut}C_{Ut} + \frac{B_t}{R_t} = B_{t-1} + W_tL_t + \Pi_t + T_t$$

Solution to Households' Problem

- ullet Euler equation for the local bond: $eta R_t E_t \left(rac{C_{t+1}}{C_t}
 ight)^{-\sigma} = 1$
- Labor supply equation: $C_t^{\sigma} L_t^{\eta} = \frac{W_t}{P_t}$
- Demand for local and US goods:

$$C_{Lt} = a \left(rac{P_{Lt}}{P_t}
ight)^{-\phi} C_t, \quad C_{Ut} = (1-a) \left(rac{P_{Ut}}{P_t}
ight)^{-\phi} C_t$$

Demand for differentiated goods produced within each country:

$$C_t(I) = \left(\frac{P_t(I)}{P_{Lt}}\right)^{-\theta} C_{Lt}, \quad C_t(u) = \left(\frac{P_t(u)}{P_{Lt}}\right)^{-\theta} C_{Ut}$$

Monetary Policy

- Producer currency pricing (PCP): law of one price $P_t(I) = \mathcal{E}_t P_t^*(I)$
- Firms cannot reset price with probability ξ (Calvo'83)

$$\max_{\left\{P_{t}(I), \mathcal{E}_{t}P_{t}^{*}(I)\right\}} E_{t} \left\{ \sum_{k=0}^{\infty} Q_{t,t+k} \xi^{k} \left(\begin{array}{c} (1+\tau_{t}) \left[P_{t}(I)Y_{t+k}(I) + \mathcal{E}_{t}P_{t}^{*}(I)Y_{t+k}^{*}(I) \right] \\ -MC_{t+k}(I) \left[Y_{t+k}(I) + Y_{t+k}^{*}(I) \right] \end{array} \right) \right\}$$

New Keynesian Phillips Curve:

$$\pi_{Lt} = \beta E_t \pi_{Lt+1} + \kappa \Big[\tilde{Y}_{Lt} - \underbrace{2 \text{a} (1-\text{a}) (\phi-1) \tilde{\mathcal{T}}_t}_{\text{Terms-of-trade gap}} + \underbrace{(1-\text{a}) \tilde{\mathcal{W}}_t}_{\text{Risk-sharing wedge}} + \underbrace{\mu_t}_{\text{Markup shock}} \Big]$$

- Slope of NKPC: $\kappa = (1 \xi)(1 \xi\beta)/\xi$
- Shocks: productivity A_t and markup $\mu_t = \theta/(\theta-1)(1-\tau_t)$

Monetary Policy

Effects of terms-of-trade gap: (Clarida/Gali/Gertler'02)

- Consider US output $\tilde{Y}_{Ut} \uparrow$, local appreciation, import price $\downarrow (\tilde{T}_t \downarrow)$
- $\phi > 1$: Local and US goods are substitutes
 - Import price \Downarrow , local consumption $C_t \Uparrow$ via risk sharing
 - Marginal cost $w_t = \frac{V'(L_t)}{U'(C_t)} \uparrow$, inflation $\pi_{Lt} \uparrow$
- $\phi < 1$: Local and US goods are complements
 - Export price $\uparrow \rightarrow$ marginal benefit of export \uparrow , inflation $\pi_{Lt} \downarrow$

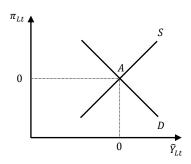

Effect of demand gap: (Corsetti/Dedola/Leduc'10)

• $W_t \Uparrow = U'(C_t) \Downarrow \to \text{marginal cost } w_t = \frac{V'(L_t)}{U'(C_t)} \Uparrow$, inflation $\pi_{Lt} \Uparrow$

Monetary Policy Trade-off: Special Case

- Assume inflation targeting $(\pi_{Lt} = 0)$ & trade elasticity = 1
- ullet Local productivity $A_t \uparrow has no effect on <math> ilde{\mathcal{W}}_t$
 - \rightarrow Inflation = output gap = 0 (No trade-offs)

Evidence for Limits to Arbitrage: UIP Deviation

Source: Valchev (2015).

- If households could invest freely in two currencies, the excess return is zero (uncovered interest rate parity holds). However, UIP does not hold in data.
- Fama (1985) regression: $e_{t+1} e_t (i_t i_t^*) = \alpha_0 + \beta_1(i_t i_t^*) + \epsilon_t$
- When $\beta_1 < 0$, high interest rate currency appreciates in future = positive return

Friction in International Asset Market

- China buys the yuan \rightarrow return on yuan < \$
- ullet Financiers are risk-averse ightarrow risk premium on \$

• Risk-averse financiers trade local & US bonds (Itskhoki/Mukhin'21)

$$\max_{d_t} E_t \left\{ -\frac{1}{\omega} \exp\left(-\omega^F \bar{R}_t d_t\right) \right\}$$

- $\omega^F > 0$: risk aversion
- \bar{R}_t : local \$ bond return ($\neq 0$ when risk-averse)
- d_t: local bond purchases (\$ sales)

UIP condition (General Case)

$$\underbrace{E_t \tilde{\mathcal{W}}_{t+1} - \tilde{\mathcal{W}}_t}_{\Delta \text{ Demand gap}} = \underbrace{\tilde{r}_t - \tilde{r}_t^* - E_t \Delta \tilde{e}_{t+1}}_{\text{UIP deviation}} = \underbrace{\chi_1(n_t^* - f_t)}_{\text{Noise trader buys $ (n_t^*)$}} - \underbrace{\chi_2 b_t}_{\text{HHs' savings}}$$

where
$$\omega_1 \equiv m_n(\omega \sigma_e^2/m_d)$$
, $\omega_2 \equiv \bar{Y}(\omega \sigma_e^2/m_d)$ for finite $(\omega \sigma_e^2/m_d)$.

- The risk aversion ω is scaled so that $\omega \sigma_e^2$ is finite and nonzero and risk premium is first-order. (Hansen/Sargent'11)
- I assume $\omega_2 = 0$ for analytical traceability.
 - The financial sector's population (m_d financiers and m_n traders) is larger than households.

$$oldsymbol{ar{R}}_t \equiv R_t - R_t^* rac{\mathcal{E}_{t+1}}{\mathcal{E}_t}$$
: local $-$ \$ bond return

Zero net position (aggregate):

$$B_t/R_t + \mathcal{E}_t B_t^*/R^* = 0, \quad U_t/R_t + \mathcal{E}_t U_t^*/R^* = 0,$$

 $D_t/R_t + \mathcal{E}_t D_t^*/R^* = 0, \quad F_t/R_t + \mathcal{E}_t F_t^*/R^* = 0$

Market clearing:

Monetary Policy

$$B_t + U_t + D_t + F_t = 0$$
, $B_t^* + U_t^* + D_t^* + F_t^* = 0$

Loss Function (PCP, Details)

$$\mathcal{L} = -E_0 \sum_{t=0}^{\infty} \beta^t \frac{1}{2} \begin{bmatrix} (\tilde{Y}_{Lt}^2 + \tilde{Y}_{Ut}^2) + \frac{\theta}{\kappa} (\pi_{Lt}^2 + \pi_{Ut}^{*2}) \\ -\frac{2a(1-a)(\phi-1)}{4a(1-a)(\phi-1)+1} (\tilde{Y}_{Lt} - \tilde{Y}_{Ut})^2 \\ +\frac{2a(1-a)\phi}{4a(1-a)(\phi-1)+1} \tilde{\mathcal{W}}_t^2 \end{bmatrix},$$

where
$$\tilde{Y}_{Lt} - \tilde{Y}_{Ut} = [\{4a(1-a)(\phi-1)+1\}\frac{\tilde{\mathcal{T}}_t}{\mathcal{T}_t} + (2a-1)\tilde{\mathcal{W}}_t].$$

- ullet Local supply $ilde{Y}_{Lt} \uparrow \!\!\! \uparrow \; o$ local currency cheap, import price $ilde{\mathcal{T}}_t \uparrow \!\!\! \uparrow$
- $\tilde{\mathcal{W}}_t \neq 0$ under incomplete asset market
 - Under complete market, local productivity ↑
 - → local HHs lend to US HHs to smooth consumption

Calibration

- Estimate the effect of FXI on UIP deviation
 - 2000-23, quarterly, 11 major currencies against the dollar
 - UIP deviation: exchange rate forecast & interbank rate (Bloomberg)
 - FXI: central bank websites, FRED, IMF data (Adler/etal'23)
- Identify FXI via deviation from estimated policy rules

(Fratzscher/etal'19, Rodnyansky/Timmer/Yago'24)

• Result: sell \$ (1% of GDP) \rightarrow UIP \Downarrow by 0.51pp (local return \Downarrow)

Countries / Summary Statistics

Countries:

- Australia, Brazil, Canada, China, Euro area, India, Japan, Korea, Russia, Switzerland, and the United Kingdom
 - <u>Robustness:</u> exclude small-open economies (Australia, Canada, Korea, and Switzerland) and managed exchange rate regime (China)

Summary Statistics of FXI:

| | Mean | Median | SD | p25 | p75 | p90 | Max | Obs |
|-------------------------|-------|--------|-------|------|-------|-------|--------|-----|
| Sell Dollars (Billions) | 10.19 | 2.09 | 24.65 | 0.74 | 7.73 | 22.10 | 179.88 | 262 |
| Buy Dollars (Billions) | 14.66 | 5.53 | 25.71 | 1.59 | 13.21 | 33.79 | 164.17 | 448 |
| | | | | | | | | |
| | Mean | Mediar | n SD | p25 | p75 | p90 | Max | Obs |
| Sell Dollars (% GDP) | 0.48 | 0.18 | 0.92 | 0.06 | 0.52 | 1.09 | 9.11 | 262 |
| Buy Dollars (% GDP) | 0.91 | 0.35 | 1.79 | 0.13 | 1.02 | 2.08 | 19.86 | 448 |

Parameter Values

Table 1: Parameter Values

| Value | Description | Notes |
|----------------------|-----------------------------------|---|
| $\beta = 0.995$ | Discount factor (local) | Annual interest rate = 2% |
| $\sigma = 2$ | Relative risk aversion | Itskhoki and Mukhin (2021) |
| $\eta = 0.35$ | Inverse Frisch elasticity | Bodenstein et al. (2023) |
| $\zeta_I = 13.3$ | Labor disutility (local) | ${\sf Steady\text{-}state\ labor} = 1/3$ |
| a = 0.88 | Home bias of consumption | Bodenstein et al. (2023) |
| $\phi = 2.0$ | CES Local & US goods | Bodenstein et al. (2023) |
| $\theta=10$ | CES differentiated goods | $Price\ markup = 11\%$ |
| $\xi_p = 0.60$ | Calvo price stickiness | Duration of four quarters |
| $\bar{\pi}=1$ | Steady-state inflation | |
| $\chi=1.42$ | UIP coefficient on FXI | $\Delta(\textit{UIP})/\Delta(\textit{FXI}/\textit{GDP}) = 0.47$ |
| $\rho_{\rm a}=0.97$ | Persistence of productivity shock | Itskhoki and Mukhin (2021) |
| $ ho_{\mu}=0.2$ | Persistence of markup shock | Bodenstein et al. (2023) |
| $\sigma_a = 0.015$ | SD of productivity shock | Bodenstein et al. (2023) |
| $\sigma_{\mu}=0.019$ | SD of markup shock | Bodenstein et al. (2023) |

Identification of FXI

Identify direct effect of FXI by deviations from an FXI policy rule

$$FXI_{i,t} = \alpha + \beta X_{i,t-1} + \gamma_i + \epsilon_{i,t}$$

- $FXI_{c,t}$: FXI in country i, quarter t (> 0: sell \$, % over GDP)
- $X_{i,t-1}$: controls (lagged)
 - Past FXI over GDP ratio, trend/volatility of the spot exchange rate, UIP deviation, VIX, local/US policy rates, consumer price inflation, unemployment rate, current account over GDP ratio
- γ_i : country fixed effect

First-step Regression

| Dependent Variable | FXI / G | FXI / GDP (%) | |

| Identified | | ✓ | | ✓ |
| Exclude Small Economy | | | ✓ | ✓ |
| Exclude Fixed Exchange Rate | | | ✓ | ✓ |

- Sell \$ (1% of GDP) \rightarrow UIP \Downarrow by 0.5-0.6 pp (local return \Downarrow)
- More effective without small economies (Swiss franc: liquid)

Optimal FXI + Inflation-Targeting MP (Productivity)

The local policy rate can increase (buy \$) or decrease (to target inflation).

Optimal MP and FXI Rules (Details)

▶ Back

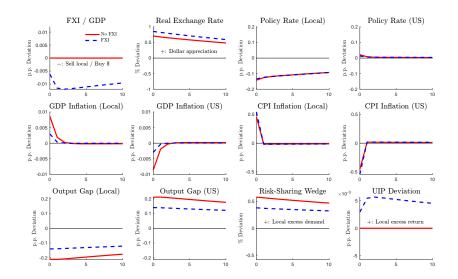

Optimal FXI Rule:
$$(\xi_Y > 0 \text{ if } \sigma \phi > 1 - \frac{1}{2a} \ (<\frac{1}{2}))$$

$$f_t^* = -\xi_Y \{ (\tilde{Y}_{Lt} - E_t \tilde{Y}_{Lt+1} - (\tilde{Y}_{Ut} - E_t \tilde{Y}_{Ut+1}) \} \text{ where}$$

$$\xi_Y = \frac{2a(\sigma \phi - 1) + 1}{2a\phi_Y} \times (\text{const})$$

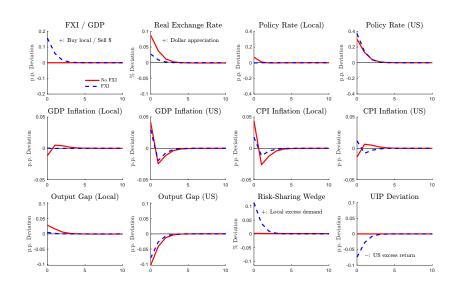

Impulse Response to a Local Productivity Increase

Impulse Response to a US Markup Increase

NKPC and Loss Function under Dollar Pricing

- NKPCs for local goods in LC (π_{Lt}) and (π_{Lt}^*) , US goods in (π_{Lt}^*)
 - Local good inflation depends on the LOOP deviation (Δ_{It})

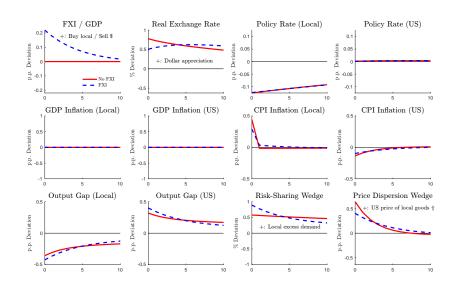

$$\begin{split} \pi_{Lt} &= \beta \pi_{Lt+1} + \kappa \{ (\sigma + \eta) \tilde{Y}_{Lt} - (1-a)[2a(\sigma\phi - 1)(\tilde{\mathcal{T}}_t + \tilde{\Delta}_{Lt}) + (\tilde{D}_t + \tilde{\Delta}_{Lt})] + \mu_t \} \\ \pi_{Lt}^* &= \beta \pi_{Lt+1}^* + \kappa \{ (\sigma + \eta) \tilde{Y}_{Lt} - (1-a)[2a(\sigma\phi - 1)(\tilde{\mathcal{T}}_t + \tilde{\Delta}_{Lt}) + (\tilde{D}_t + \tilde{\Delta}_{Lt})] - \tilde{\Delta}_{Lt} + \mu_t^* \} \\ \pi_{Ut}^* &= \beta \pi_{Ut+1}^* + \kappa \{ (\sigma + \eta) \tilde{Y}_{Ut} + (1-a)[2a(\sigma\phi - 1)\tilde{\mathcal{T}}_t - \tilde{D}_t] + \mu_t^* \} \end{split}$$

• Loss function depends on the LOOP deviation (Δ_{Lt}) :

$$\mathcal{L} = -E_0 \sum_{t=0}^{\infty} \beta^t \frac{1}{2} \left[\begin{array}{l} (\sigma + \eta) \left(\tilde{Y}_{Lt}^2 + \tilde{Y}_{Ut}^2 \right) + \frac{\theta}{\kappa} \left(a \pi_{Lt}^2 + (1-a) \pi_{Lt}^{*2} + \pi_{Ut}^{*2} \right) \\ - \frac{2a(1-a)(\sigma\phi - 1)\sigma}{4a(1-a)(\sigma\phi - 1) + 1} \left(\tilde{Y}_{Lt} - \tilde{Y}_{Ut} \right)^2 \\ + \frac{2a(1-a)\phi}{4a(1-a)(\sigma\phi - 1) + 1} \left(\tilde{W}_t + \Delta_{Lt} \right)^2 \end{array} \right]$$

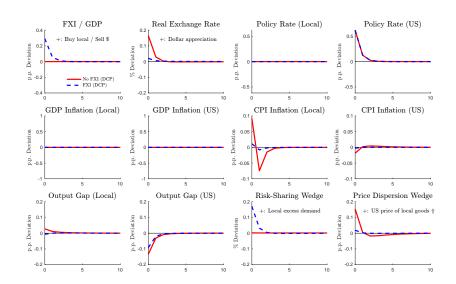

DCP, Local Productivity Increase

DCP, US Cost-Push Inflation

Maximization Problem (Non-Cooperation)

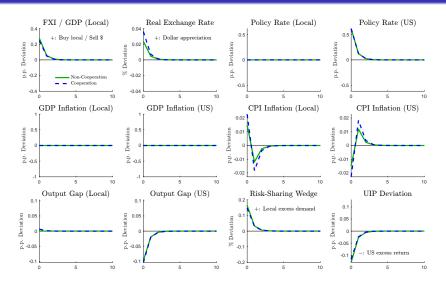

• The local CB solves:

$$\begin{aligned} \max \mathcal{L} &= -E_0 \sum_{t=0}^{\infty} \beta^t \frac{1}{2} \left[\tilde{Y}_{Lt}^2 + \frac{\theta}{\kappa} \pi_{Lt}^2 \right] \quad \text{s.t.} \\ \pi_{Lt} &= \beta E_t \pi_{Lt+1} + \kappa \big[\tilde{Y}_{Lt} - 2 \text{a} (1-\text{a}) (\phi-1) \tilde{\mathcal{T}}_t + (1-\text{a}) \tilde{\mathcal{W}}_t, \\ E_t \tilde{\mathcal{W}}_{t+1} - \tilde{\mathcal{W}}_t &= -\bar{\omega} f_t \end{aligned}$$

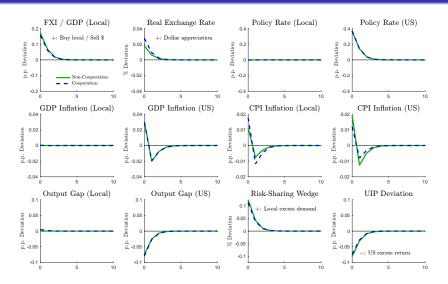

Optimal MP & FXI rules:

$$\begin{aligned} 0 &= \theta \pi_{Lt} + \frac{\sigma + \eta}{\sigma + \eta - \frac{(1-a)(\sigma-1)}{2a(\phi-1)+1}} (\tilde{Y}_{Lt} - \tilde{Y}_{Lt-1}) \\ E_t \tilde{Y}_{Lt+1} &= \tilde{Y}_{Lt} \quad (E_t \tilde{\pi}_{Lt+1} = 0) \end{aligned}$$

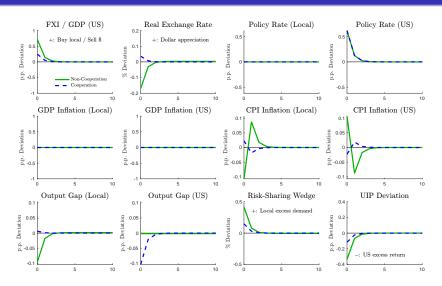

Non-Cooperative FXI by Local CB (Inflation-Targeting)

Non-Cooperative FXI by Local CB (Full Optimal)

Non-Cooperative FXI by US CB (Inflation-Targeting)

Non-Cooperative FXI by US CB (Full Optimal)
